Inner and outer display

Inner and outer display types

At this point, we'd better also explain **inner** and **outer** display types. You already know, that boxes in CSS have an _outer_ display type, which details whether the box is block or inline.

Boxes also have an _inner_ display type, however, which dictates how elements inside that box are laid out. By default, the elements inside a box are laid out in normal flow, which means that they behave just like any other block and inline elements.

Take a look at the outer and inner demo.
